A Short Talk

D. Speaker

November 2026

The problem

- We want a bound for $\Pr(|S_n - \mathbb{E}S_n| \geq t)$.
- The variables are independent and bounded.

Theorem

$\Pr(|S_n - \mathbb{E}S_n| \geq t) \leq 2\exp\left(-2t^2 / \sum_i (b_i - a_i)^2\right)$.

Results

n	bound
10	0.330
100	0.271
1000	0.081
